An approximate identity (in the sense that you've described) is a sequence of operators, usually derived from some "nice" class, that converge to the identity operator in the ...

The "and" is a pointer that (a) first we approximate and (b) then we compute exactly. The final result is an approximation only because of (a). Related to this, it is useful to ...

How to approximate  $e^{-x}$  when  $x$  is large Ask Question Asked 3 years ago Modified 3 years ago

Approximate solution to an equation with a high-degree polynomial Ask Question Asked 3 years, 11 months ago Modified 3 years, 11 months ago

A continuous linear operator is not invertible if it is not bounded from below, and since the spectrum consists of the  $\lambda$  such that  $T - \lambda I$  is not injective, ...

One can, for example, approximate continuous functions with polynomial functions, in which case the idea is to keep the area between the original function and the approximating function ...

For example, the inverter costs scale according to the power capacity (i.e., kW) of the system, and some cost components such as the developer costs can scale with both power and energy.
