Wind turbines work on a simple principle: instead of using electricity to make wind--like a fan-- wind turbines use wind to make electricity. Wind turns the propeller-like blades of a turbine ...

Direct-drive wind turbines use a system where the rotor is directly connected to the generator without the need for a gearbox. This setup eliminates the traditional gearbox that ...

Discover the essential wind turbine components with our detailed guide to the anatomy of wind turbines. Learn the main parts, structure, blade sections, electrical elements, ...

Over the past 20 years, wind turbine manufacturers have experimented with various drivetrain architectures, evolving their designs based on technological progress and ...

At the core of every wind turbine lies a complex and powerful system that enables the conversion of wind energy into electricity. One of the most critical systems within that setup ...

Direct-drive wind turbines use a system where the rotor is directly connected to the generator without the need for a gearbox. This ...

The drivetrain of a wind turbine is composed of the gearbox and the generator, the necessary components that a turbine needs to produce electricity. The gearbox is responsible for ...

The main function of a drive train is power transmission, i.e. to convert the mechanical energy at the rotor hub of the wind turbine to electrical energy, and to send it to the load/grid. The main ...
