Here's a table that shows the relationship between battery capacity, C-rate, discharge time, and discharge current for lead-acid, nickel, and lithium batteries.

At increased discharge currents there is a decline in the quantity of charge that can be extracted before the voltage drops to the minimum acceptable value, as indicated by the dotted line in ...

Maximum Continuous Discharge Current - The maximum current at which the battery can be discharged continuously. This limit is usually defined by the battery manufacturer in order to ...

Maximum continuous discharge current sounds like what is the maximum drain current that will remain safe on the battery without "abusing" it and thereby shortening battery life.

When a battery is discharged at a high rate, the available capacity may be reduced compared to a low-rate discharge. This ...

Well, it's the highest amount of current that a lead - acid battery can safely deliver over a short period without causing significant damage to the battery or reducing its lifespan.

To protect the battery from over-discharging, most devices prevent operation beyond the specified end-of-discharge voltage. When ...

Overdischarge of the battery may bring catastrophic damage to the battery consequences, especially large current over-discharge, or repeated over-discharge will have a greater impact ...
