What is 5G cell reference power?

Cell Reference Power determines the baseline power for a 5G cell and depends on bandwidth, RBs, and hardware capabilities. SS-PBCH-Block Power is a crucial parameter for enhancing signal strength, calculated by adding a boost power value to the cell reference power.

How much power does a 5G system need?

To keep the power density per MHz similar to LTE systems, the 100MHz 3.5GHz spectrum will require 5x 80 W, which is not easy to be achieved. 5G trials need to define a realistic output power trade-off between coverage, power consumption, EMF limits, and performance.

What does 5G NR mean?

5G NR (New Radio) Total Transmit Power, Maximum Cell Transmit Power, and Reference Signal Power. The total transmit power in a 5G NR system refers to the overall power emitted by a transmitter, which includes both the power used for carrying data (payload) and the power used for various control signals and reference signals.

What are 5G NR base stations?

As per 3GPP specifications for 5G NR, it defines three classes for 5G NR base stations: These classes are as per cell types deployments like Macrocell, Microcell, and Pico cell. Wide Area base station: No upper limit
Medium Range base station: ≤ 38 dBm or 6.3 watts
Local area base station: ≤ 24 dBm or 0.25 watts
BS type 1-C

Output power is typically limited by the EMF constraints of the site. In general, the nominal output power has to be defined by the cell size and the required data rate at the cell edge.

The measured OSTP result is -1.02 dBm for the maximum base station transmit power. It is measurable with test model 3.1, which is easily configurable by selecting from the test model list.

I. Reference Signal Power This is the power value measured and reported by the terminal (UE) and the total transmit power of the cell can be calculated by the following formula ...

Determine the maximum power capability of your hardware (e.g., 320 Watts, as shown in the example).
Confirm the number of TX/RX branches (antenna branches) ...
